SPECIFICATIONS

Measurement Conditions

Power supply voltage	12.0 V DC
Modulation frequency and modulation percentage	1000 Hz, 30%
Audio output power	100 mW
Audio output load	8 ohm (resistive)
Antenna impedance	50 ohm, non-inductive
Signal input level	1000 μ V
Measuring channel	18
Temperature	77°F (25°C)
Humidity	44 to 70%

TRANSMITTER

		Unit	Nominal	Limit	
Frequency tolerance at 77°F (25°C) (5 minutes after switch on)		Hz	± 100	± 1300	
Carrier power at no modulation	at High	W	2.5	2.5 ± 0.4	
	at Low	W	1.0	1.0 ± 0.4	
Modulation attack time		msecond	18	25	
Modulation release time		msecond	250	100–500	
Modulation distortion at 1 kHz 80% modulation		%	3	6	
Spurious emission 2nd / 3rd / 4th / 5th / 6th 7th / 8th / 9th / 10th		dB	–70	–60	
Modulation 100% capability positive/negative		%	90	80	
Current drain at no modulation	at High	mA	650	800	
	at Low	mA	450	600	
Current drain at 80% modulation	at High	mA	950	1200	
	at Low	mA	650	900	
Modulation frequency response (1000 Hz 0dB reference)	450 Hz	dB	–6	-6 ± 3	
	2500 Hz	dB	–6	-6 ± 3	
Carrier power uniformity CH. to CH. at no modulation	at High	W	0.2	0.5	
	at Low	W	0.1	0.2	
Microphone sensitivity for 50% modulation		mV	2	4	
AMC range between 50 to 100% modulation		dB	40	30	
Occupied bandwidth	± 5.0 kHz	dB	–35	–26	
	± 7.5 kHz	dB	–35	–26	
	± 10.0 kHz	dB	–45	–35	
	± 12.5 kHz	dB	–45	–35	
	± 15.0 kHz	dB	–45	–35	
	± 17.5 kHz	dB	–45	–35	
	± 20.0 kHz	at High	dB	–65	–57
		at Low	dB	–65	–53
± 22.5 kHz	at High	dB	–65	–57	
	at Low	dB	–65	–53	

RECEIVER

		Unit	Nominal	Limit
Maximum sensitivity		μV	0.25	0.5
Sensitivity for 10 dB S/N		μV	0.5	1.0
Squelch Sensitivity	at threshold	μV	1.0	2.0
	at tight	μV	1000	316 – 3162
AGC fig. of merit 50 mV for 10 dB change in audio output		dB	90	70
Overload AGC characteristics from 50 mV to 1 V		dB	3	3 ± 5
Overall audio fidelity (1000 Hz 0dB reference)	450 Hz	dB	-6	-6 ± 3
	2500 Hz	dB	-6	-6 ± 3
Adjacent channel selectivity (± 10 kHz)		dB	60	55
Maximum audio output power		mW	600	450
Audio output power at 10% THD		mW	400	250
THD at 100 mW, 1000 μV input, 30% modulation		%	2.0	5.0
	50% modulation	%	3.0	6.0
	80% modulation	%	6.0	8.0
S/N ratio at 1000 μV input		dB	45	38
Image rejection ratio (1st IF / 2nd IF)		dB	45	35
1/2 IF rejection ratio (2nd IF)		dB	60	50
IF rejection ratio (1st IF / 2nd IF)		dB	70	60
Spurious rejection ratio		dB	50	40
Skirt rejection ratio (± 20 kHz)		dB	60	50
Cross modulation, RS standard		dB	50	40
Desensitvity at 100 μV desired		dB	50	40
	20 kHz away, 3 dB desensitvity			
Oscillator on voltage		V	8.0	9.0
Current drain at no signal		mA	85	100
Current drain at maximum power output		mA	300	450
Battery test LED on voltage		V	9.0	8.1 – 9.6
Battery charging current		mA	60	60 ± 20
Local OSC emission at antenna terminal		dBm	-73	-67

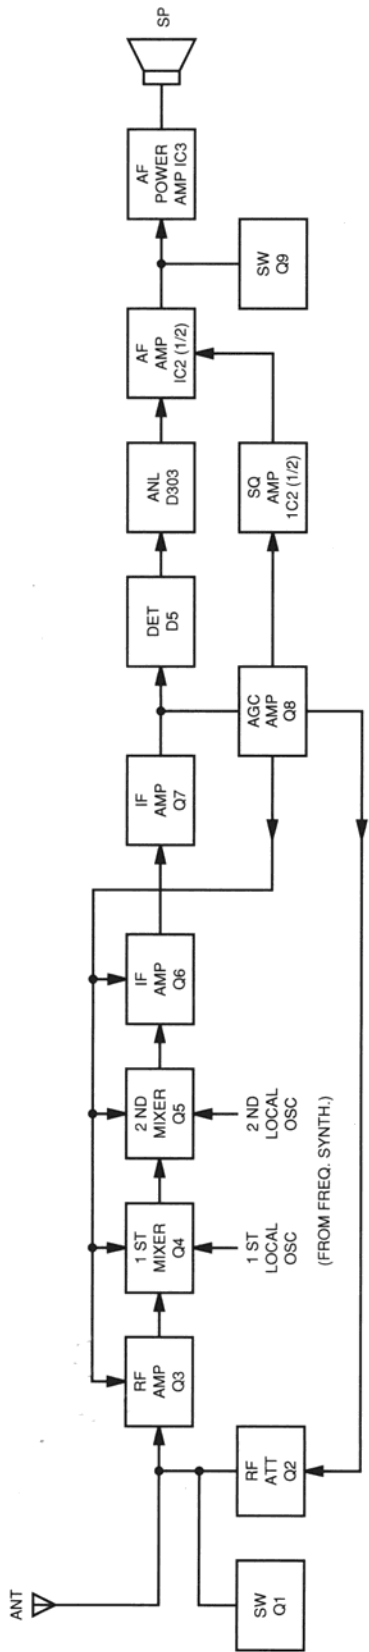

Note: Nominal specs represent the design specs. All units should be able to approximate these – some will exceed and some may drop slightly below these specs. Limit specs represent the absolute worst condition that still might be considered acceptable; in no case should a unit fail to meet limit specs.

Receiver

Transmitter

CIRCUIT DESCRIPTION

General

The TRC-222 is a 40-channel, crystal controlled handy transceiver which consists of a PLL-synthesizer circuit, a receiver circuit and a transmitter circuit. Power is supplied by 12 V DC (1.5 V "AA" alkaline battery × 8 pcs or 1.2 V "AA" Ni-cd battery × 10 pcs). Refer to the Block Diagram and the Schematic Diagram as you read the following descriptions.

PLL Synthesizer Section

The TRC-222 uses a Phase-Locked-Loop (PLL) circuit to synthesize the local-oscillator frequencies for receiving and transmitting.

It employs one IC and only one crystal. IC1 is a CMOS large scale integrated circuit containing a reference oscillator, phase detector, active low pass filter, reference divider(1/4096) and a programmable divider.

The programmable divider directly divides the output of the VCO (voltage controlled oscillator) down to a 2.5 kHz signal. Crystal X1 provides a reliable frequency standard which controls the local-oscillator frequencies. The reference-frequency divider inside IC1 counts down the oscillator signal to 1/4096, and passes it on to the phase detector, where it is compared with the 2.5 kHz signal from the programmable divider. An error voltage is generated by the phase detector, which is proportional to the phase difference between the two 2.5 kHz signals.

This error voltage appears at pin 27 of IC1 and passes through the active LPF (low pass filter), where the error voltage is integrated and harmonics and noise are filtered out. The resulting DC voltage is applied to the varicap diode (D8). Its capacity varies with the applied DC voltage. Because of this capacity change, the output frequency of the VCO is corrected. With proper circuit design and precise adjustments, the VCO frequency is accurate and precise when the system is "locked".

This means that the phase detector senses no phase differences between the two 2.5 kHz signals, and the VCO generates a frequency that is as accurate and stable as the reference crystal oscillator. The VCO circuit consists of D8, Q14 and T6.

The circuit is connected in the form of a Hartley oscillator with varicap diode D8 as part of the tank circuit. The VCO circuit generates a signal ranging from 13.4825 to 16.710 MHz. The IC1 also includes an unlock-signal-detector circuit. Should the condition occur, the output at pin 18 of IC1, which is normally open, will be shorted to ground. This means that VCO frequency (1/2 carrier for transmitting) is "sunk" to pin 18 of IC1 and the transmitter circuit are inhibited.

Transmitter Circuit

RF Amplification

The output of doubler amp Q17 is fed through doubler tuning (27 MHz) T7 and T8 to the base of RF amp Q18. The output is then supplied through tuning circuit T9 to RF driver amp Q19. The Q19 output capacitance is divided by tuning circuit L8, C86 and C87 and passed through tuning circuit L9 to the base of final RF stage Q20.

Suppression of Spurious Radiation

The tuning circuit between frequency synthesizer and final amp Q20, and 3-stage "PI" network C89, L12, C91, L13, C3, L3 and C2 in the Q20 output circuit serve to suppress spurious radiation. This network serves to match Q20 impedance to the antenna and to reduce spurious content to acceptable levels. In-band spurious is reduced to acceptable levels by filtering.

Limiting Power

During factory alignment, the series base resistor of final Q20(R95) is selected to limit the available power. The tuning is adjusted so the actual power is 2.5 watts, and there are no other controls for adjusting power.

Modulation

The mic input is fed to mic amp Q12 and then to audio power IC3, which feeds the signal to the modulator transformer T5. The audio output at the step up of T5 is fed in series with the B+ voltage through diode D11 to the collectors of driver Q19 and final Q20 to collector-modulate both these stages.

Limiting Modulation

A portion of the modulating voltage is rectified by Q10 to turn on Q11, which attenuates the mic input to mic amp Q12. The resulting feedback loop keeps the modulation from exceeding 100 percent for inputs approximately 40 dB greater than required to produce 50 percent modulation. The attack time is about 18 ms and the release time is about 250 ms.

Receiver Circuit

Receiver

The receiver is a double conversion superheterodyne with the first IF at 10.695 MHz and the second IF at 455 kHz. The synthesizer supplies the first local oscillator 10.695 MHz below the received frequency and the second local oscillator at 10.240 MHz. The detector output provides reverse AGC to all previous stages except Q7. The AGC voltage is also amplified by Q8 and used to drive RF attenuator Q2. Squelch amp and audio amp are included in IC2.

Indicators

Channel Indication

The channel is indicated by the 2 digits/7 segments LED (LD201) and it is selected by the channel selector (SW301). The LED (LD201) lights dynamically by the outputs from IC1.

The output from pin 8 of IC1 controls the lighting of the 1st digit through Q202, and the output from pin 9 of IC1 controls the lighting of the 2nd digit through Q201.

The outputs from pin 1 to pin 7 of IC1 control the lighting of each segment of each digit.

Battery Test Indication

When the battery test switch (SW201) is pressed, the battery test LED (LD202) lights through D201 if the battery voltage is *more than 9 volts*.

FREQUENCIES GENERATED AND MIXED TO OBTAIN EACH CHANNEL

RECEIVE

*VCO FREQUENCY = (N/4096) × REFERENCE FREQUENCY (10.240 MHz)

TRANSMIT

*VCO FREQUENCY = (N/4096) × REFERENCE FREQUENCY (10.240 MHz)

*TRANSMIT FREQUENCY = VCO FREQUENCY × 2

CHANNEL NUMBER	RECEIVE		TRANSMIT		
	N	VCO FREQUENCY (MHz)	N	VCO FREQUENCY (MHz)	TRANSMIT FREQUENCY (MHz)

ALIGNMENT PROCEDURES

PLL SECTION

Test Equipment Required

- Frequency counter
- DC voltmeter (about 100 kohm)
- DC power supply (12.0 V, 2 Amp)

Note: Figure 1 provides test point and all alignment location information.

Figure 1

Test Set-up

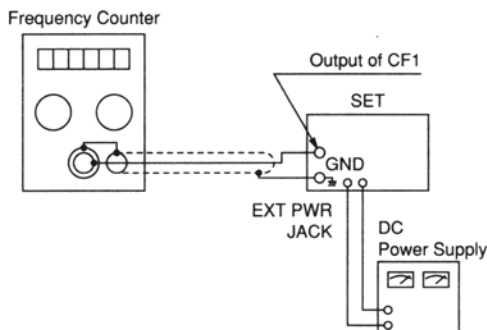

Figure 2

Figure 3

Alignment Procedure

STEP	CONTROL SETTING	OUTPUT INDICATOR CONNECTION	ADJUST	ADJUST FOR
1	Alignment of Ref. Osc.			
	PUSH TO TALK SW: Receive POWER: On VOLUME: Optional SQUELCH: Optional Channel Selector: Channel 19	Connect frequency counter to output of CF1. (Figure 2)	TC1	Adjust for 10.240 MHz \pm 100 Hz indication on frequency counter.
2	Alignment of VCO			
	PUSH TO TALK SW: Transmit POWER: On VOLUME: Optional SQUELCH: Optional Channel Selector: Channel 40	Connect DC voltmeter to hot of C64. (Figure 3)	T6	Adjust for 5.0 V indication on DC voltmeter.
3	PUSH TO TALK SW: Receive POWER: On VOLUME: Optional SQUELCH: Optional Channel Selector: Channel 1	Same as Step 2.	Check the indication on DC voltmeter (must be 2.5–3.5V). If DC voltmeter does not indicate 2.5–3.5 V, readjust T6 and return to Step 2.	

TRANSMITTER SECTION

Test Equipment Required

- RF power meter
- 50 ohm load (non-inductive)
- DC power supply (12.0 V, 2 Amp)
- Field strength meter (or spectrum analyzer)
- Frequency counter
- Coupler
- RF attenuator

Note: Figure 1 provides test point and all alignment location information.

Test Set-up

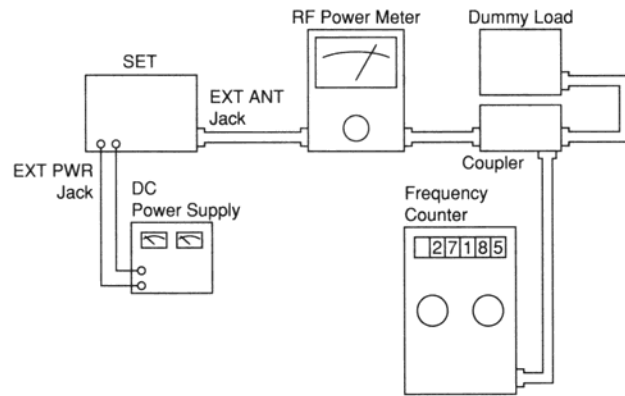

Figure 4

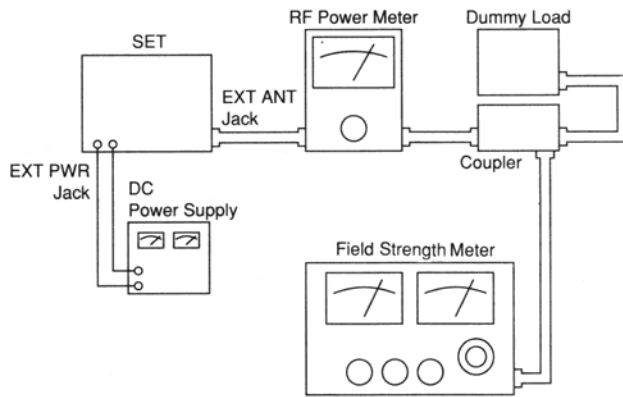

Figure 5

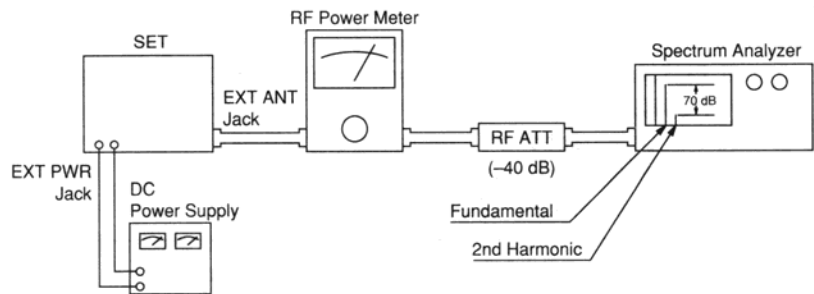

Figure 6

Alignment Procedure

STEP	CONTROL SETTING	OUTPUT INDICATOR CONNECTION	ADJUST	ADJUST FOR
1	Set power Hi/Lo switch to Hi position.			
2	Alignment of Overall			
	Set channel selector to CH19.	Connect dummy load and frequency counter through coupler to RF power meter. Connect RF power meter to EXT ANT jack on set. (Figure 4)	L13	Make the core top even with the mold top.
T7, T8 T9, L9 L12			Adjust for maximum indication on RF power meter.	
3	Repeat Step 2 twice or three times.			
4	Realignment of T9			
	Set channel selector to CH1.	Same as Step 2.	T9	Adjust for maximum indication on RF power meter.
5	Set channel selector from CH1 to CH19, then from CH19 to CH40.	Same as Step 2.	Check that difference in RF output power between channels is less than 0.2 W.	
6	Same as Step 5.	Same as Step 2.	Check that RF output power is 2.3 to 2.7W on all channels with no modulation. If it is not within the above range, go back to Steps 2 and 3 and readjust. If still improper, change R95 value.	
7	Alignment of Transmitter Frequency			
	Same as Step 2.	Same as Step 2.	TC1	Check that the transmitter frequency is 27.185 MHz \pm 300 Hz on frequency counter. If not, readjust TC1.
8	Alignment of 2nd Harmonics Spurious			
	Same as Step 2.	Connect dummy load and field strength meter through coupler to RF power meter. Connect RF power meter to EXT.ANT jack on set. (Figure 5) Tune to 2nd harmonic frequency (54.37MHz) on field strength meter. Or connect spectrum analyzer, RF attenuator and RF power meter to EXT.ANT jack on set. (Figure 6)	L2	Adjust for the minimum indication on field strength meter or spectrum analyzer. (Reference: -70 dB)

RECEIVER SECTION

Test Equipment Required

- RF signal generator
- Distortion meter
- SSVM
- Dummy load (8 ohm)
- DC power supply (12.0 V, 2 Amp)

General Alignment Conditions

- a. Signal input must be kept as low as possible, to avoid overload and clipping. (Use highest possible sensitivity of output indicator.)
- b. Standard modulation is 1000 Hz at 30% amplitude.
- c. A non-metallic alignment tool must be used for all adjustments.
- d. Power supply is adjusted for 12.0 V DC, 2 A.

Note: Figure 1 shows test point and all alignment location information.

Test Set-up

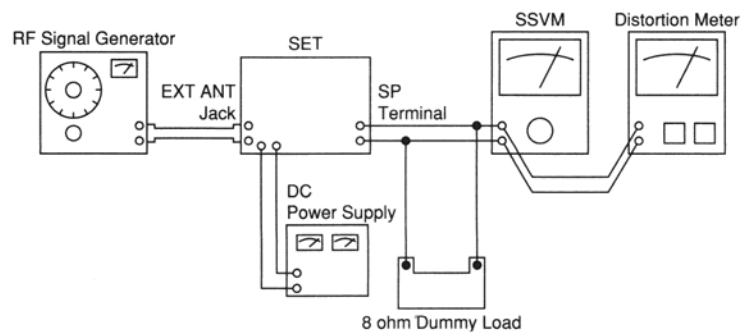

Figure 7

Alignment Procedure

STEP	SIGNAL SOURCE CONNECTION	OUTPUT INDICATOR CONNECTION	ADJUST	ADJUST FOR
1	Set channel selector to CH19.			
2	Turn VR1 (VOLUME) fully clockwise.			
3	Turn VR2 (SQUELCH) fully counterclockwise.			
4	Alignment of Overall			
	1) Set RF signal generator: 0.3 μ V at 1 kHz, 30% mod. 2) Audio output is 100mW (Ref.output power).	1) Connect RF signal generator to EXT. ANT. jack. 2) Connect SSVM and distortion meter to speaker terminal with 8 ohm dummy load. (Figure 7)	T1, T2 T3, T4	Adjust for maximum indication on SSVM.
5	Repeat Step 4 twice or three times.			
6	Realignment of T4			
	1) Set RF signal generator: 1 mV at 1 kHz, 80% mod. 2) Set VR1 so that audio output is 100 mW.	Same as Step 4.	T4	Adjust for minimum indication on distortion meter.
7	Alignment of Squelch			
	Set RF signal generator: 1 mV at 1 kHz, 30% mod. SQUELCH: Fully clockwise.	Same as Step 4.	VR3	Adjust VR3 so that audio output is turned on.

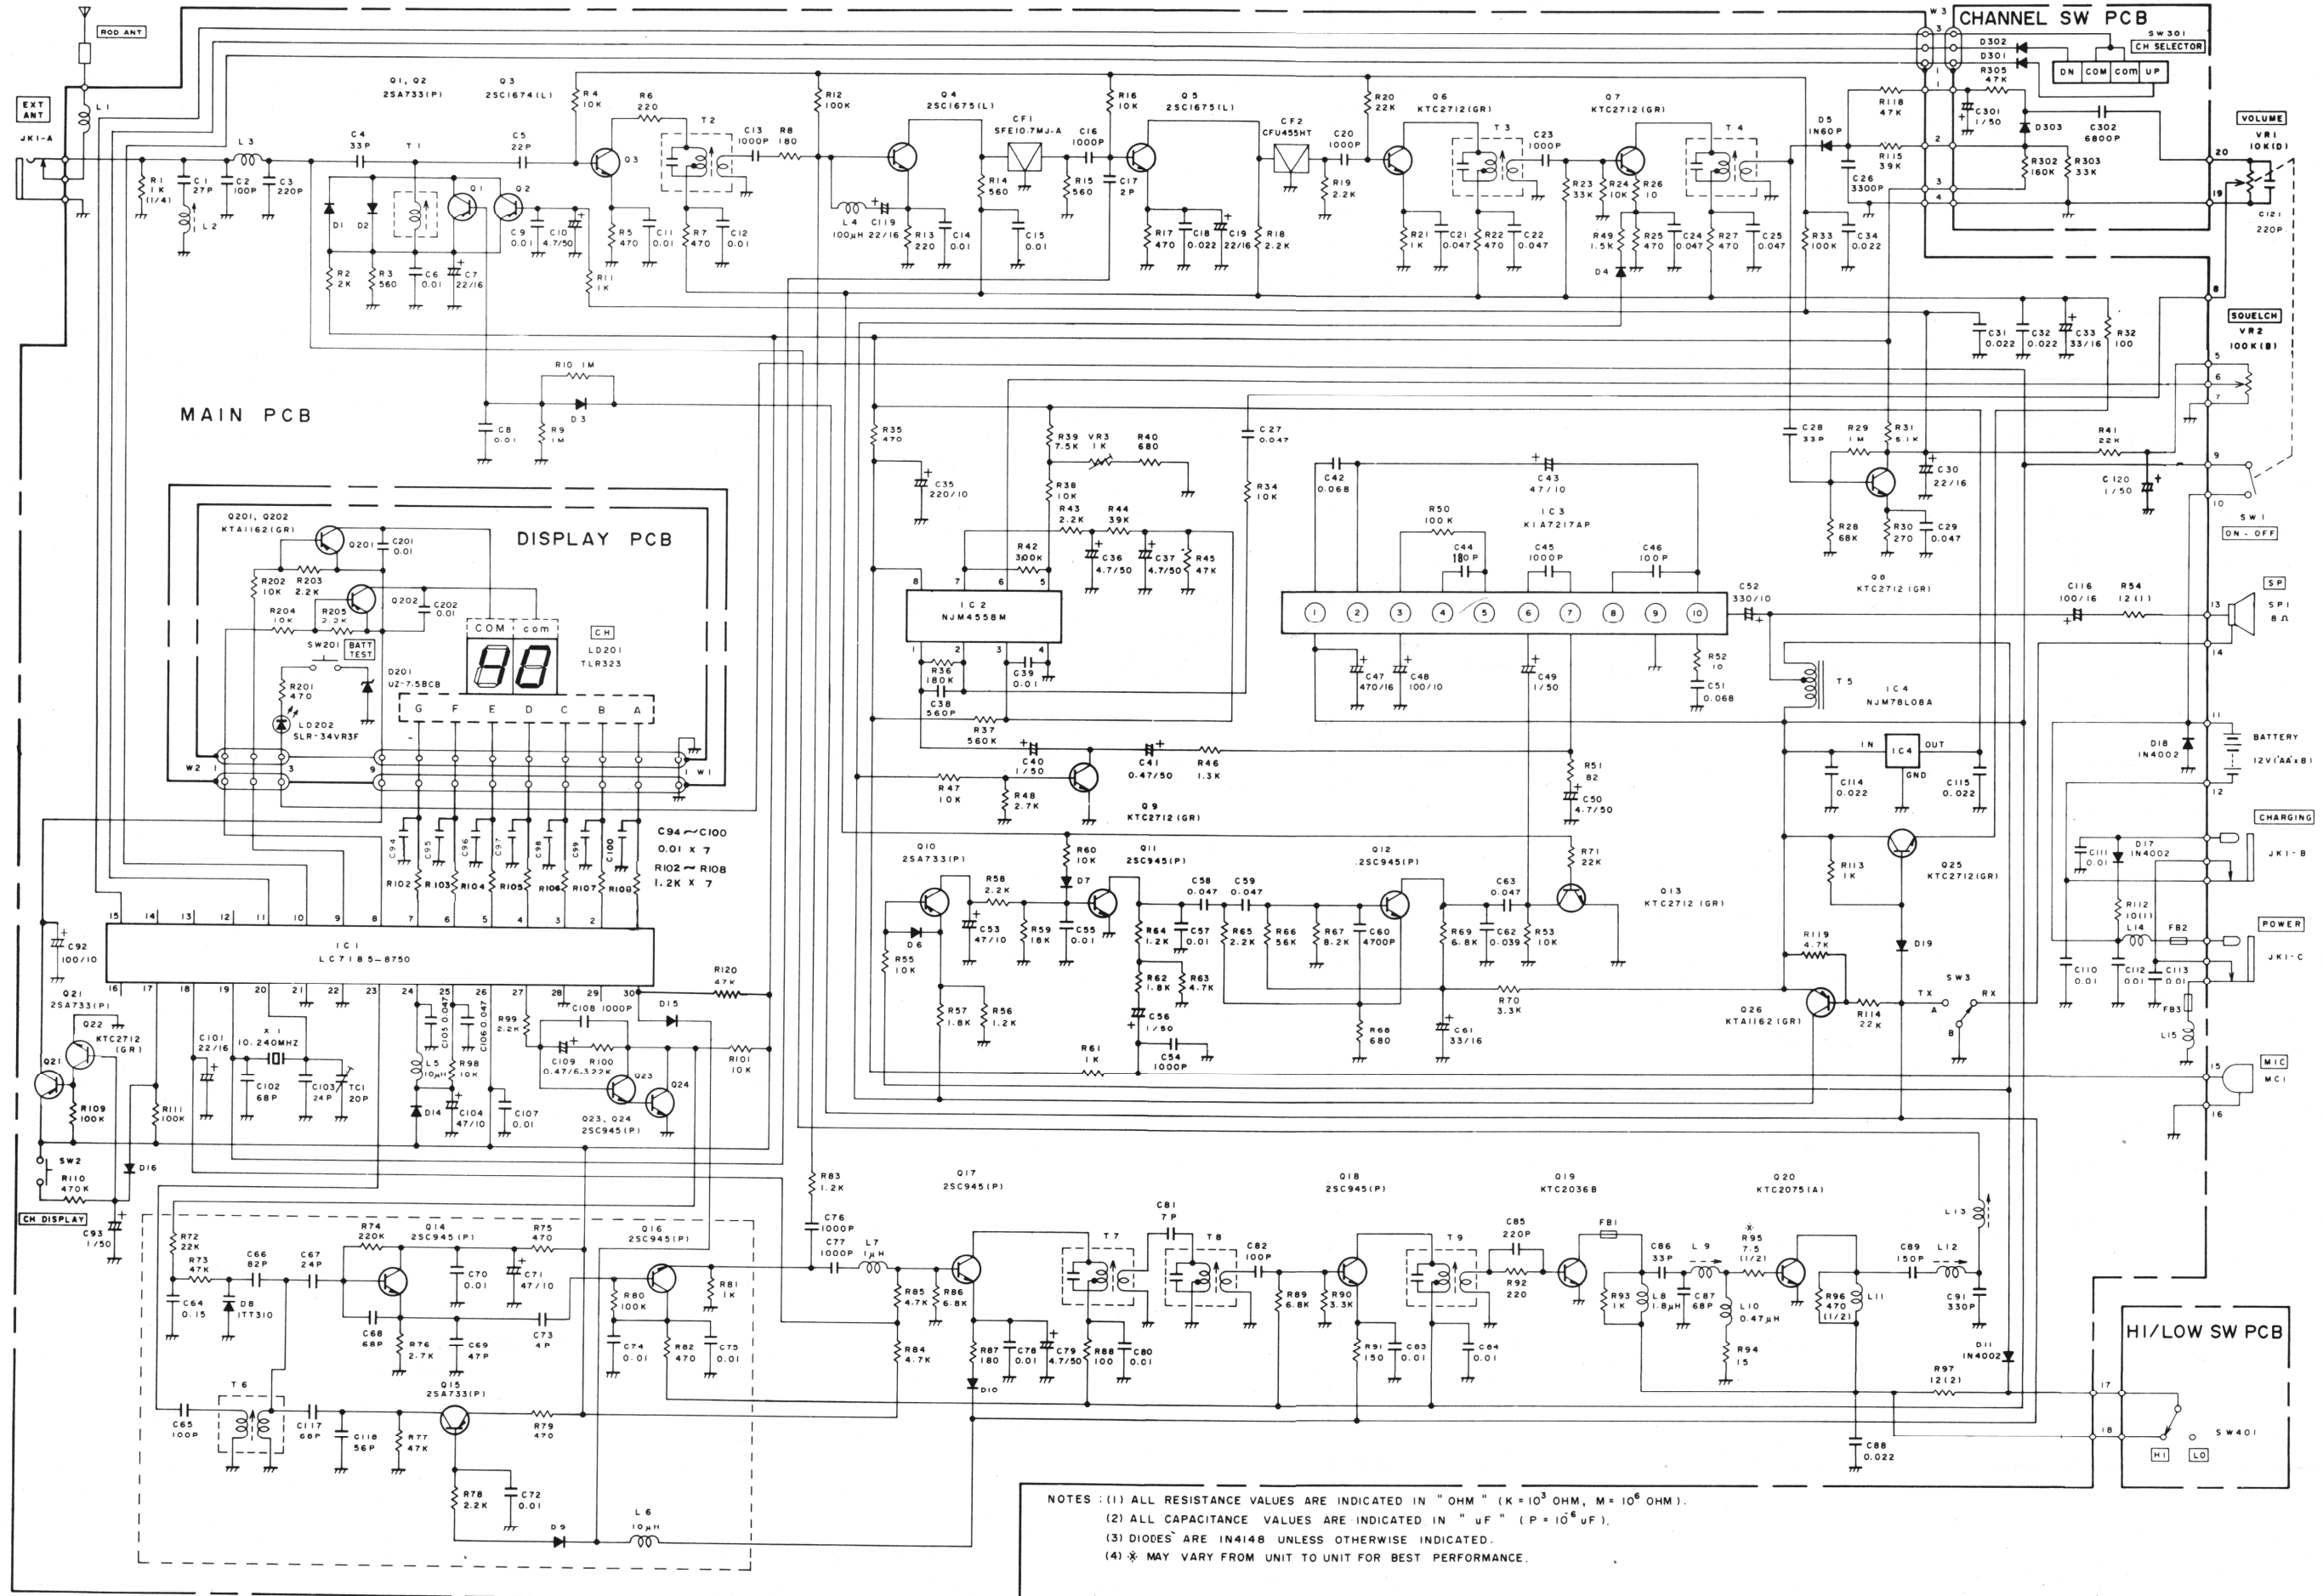

EXPLODED VIEW/DISASSEMBLY INSTRUCTIONS

Disassembly Instructions

1. Remove one screw S2 and two screws S1 from back cabinet assembly 3-1.
2. Pry back cabinet assembly 3-1 from sleeve cabinet 4 using a screwdriver on the two hooks located at the upper right and center right of the back cabinet.
3. Pry front cabinet assembly 16-1 from sleeve cabinet 4 using a screwdriver on the two hooks located at the upper right and center right of the front cabinet.
4. To remove antenna 6, remove a screw S3.
5. To remove main PCB assembly 7, remove three screws S5 and one screw S15.
6. To remove display PCB assembly 14, remove three screws S4.

SCHEMATIC DIAGRAM

NOTES: (1) ALL RESISTANCE VALUES ARE INDICATED IN "OHM" (K = 10³ OHM, M = 10⁶ OHM).
 (2) ALL CAPACITANCE VALUES ARE INDICATED IN "UF" (P = 10⁶ UF).
 (3) DIODES ARE IN4148 UNLESS OTHERWISE INDICATED.
 (4) * MAY VARY FROM UNIT TO UNIT FOR BEST PERFORMANCE.
